

Micro-ROS Installation Steps (ROS 2)

1. Source ROS 2

Before using any ROS 2 tools or packages, source your ROS 2 installation environment by running:

```
source /opt/ros/$ROS_DISTRO/setup.bash
```

Replace \$ROS_DISTRO with your installed ROS 2 distribution (e.g., humble, foxy).

2. Create a Workspace and Clone micro-ROS Setup Repository

Create a dedicated workspace directory and download the micro-ROS setup tools:

```
mkdir microros_ws
```

```
cd microros_ws
```

```
git clone -b $ROS_DISTRO https://github.com/micro-ROS/micro_ros_setup.git  
src/micro_ros_setup
```

This command ensures you clone the branch matching your ROS 2 distribution.

3. Install Required Dependencies Using rosdep

Update the package index and install dependencies for the micro-ROS setup:

```
sudo apt update && rosdep update
```

```
rosdep install --from-path src --ignore-src -y
```

rosdep resolves and installs system dependencies defined in package.xml files.

4. Install pip (if not already installed)

Install the Python package manager (pip), required for some Python dependencies:

```
sudo apt-get install python3-pip
```

5. Build micro-ROS Setup Tools

Use colcon to build the micro-ROS setup workspace:

```
colcon build
```

Once built, source the generated setup file:

```
source install/local_setup.bash
```

6. Create and build the micro-ROS Firmware (for ESP32, STM32, etc.)

Run the following command to create a freertos based firmware for esp32.

```
ros2 run micro_ros_setup create_firmware_ws.sh freertos esp32
```

Run the following to build the firmware for your target embedded board:

```
ros2 run micro_ros_setup build_firmware.sh
```

Then source the environment again:

```
source install/local_setup.bash
```

7. Download micro-ROS Agent Packages

The agent is the bridge between the embedded device and ROS 2.

Download the agent source code:

```
ros2 run micro_ros_setup create_agent_ws.sh
```

8. Build the micro-ROS Agent

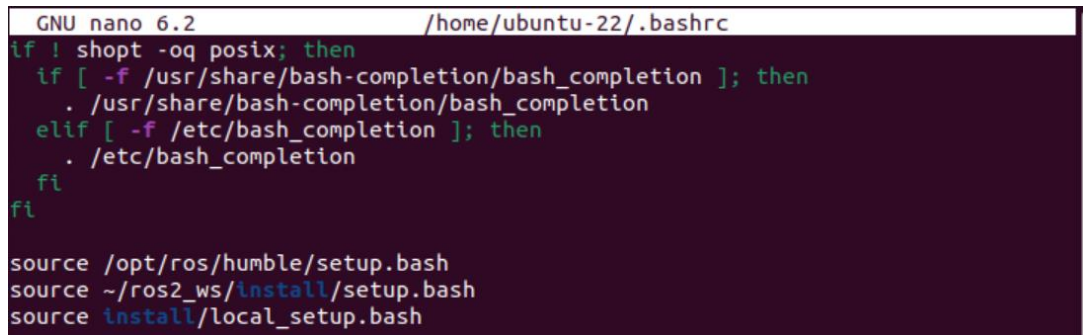

Compile the downloaded agent workspace using the following command:

```
ros2 run micro_ros_setup build_agent.sh
```

Then source the built workspace:

```
source install/local_setup.bash
```

9. Add path in bashrc files as below shown

```
GNU nano 6.2 /home/ubuntu-22/.bashrc
if ! shopt -oq posix; then
  if [ -f /usr/share/bash-completion/bash_completion ]; then
    . /usr/share/bash-completion/bash_completion
  elif [ -f /etc/bash_completion ]; then
    . /etc/bash_completion
  fi
fi

source /opt/ros/humble/setup.bash
source ~/ros2_ws/install/setup.bash
source install/local_setup.bash
```

10. Run the micro-ROS Agent (Choose Serial or UDP Based on Your Setup)

To launch the agent and establish communication with your microcontroller:

```
ros2 run micro_ros_agent micro_ros_agent serial --dev /dev/ttyUSB0
```

Replace `/dev/ttyUSB0` with the actual serial port your device is connected to.

Other transport options include UDP, TCP, or custom transports, such as following.

```
ros2 run micro_ros_agent micro_ros_agent udp4 -i 192.168.1.100 -p 8888
```
